Sherman Clay
Building Restoration
San Francisco, California

Architectural Precast Association Awards Architectural Facades Unlimited in two categories, GFRC Excellence and Craftsmanship

JURY COMMENTS:
Fantastically detailed renovation of a classical building using GFRC. The castings matched the original details and were able to do so without any noticeable transitions. The elegance of the original design is restored to this treasure of a building.

RESTORATION CASE STUDY
Sherman Clay & Co. Building was built in 1906. Exterior facade consists of ornamental terra cotta spandrels, jambs, sills, fluted and tapered columns, Doric capitals, ornamental shell parapet castings. In most cases using the original materials would make restoration costs prohibitive. The use of GFRC for restoration allows for the historical conservation of our nation’s landmarks at an achievable cost without sacrificing the original architectural facade.

The GFRC system reduces one-third of original terra-cotta weight. Lightweight GFRC castings are anchored to a new metal stud steel framing system designed by Architectural Facades. The anchorage design for GFRC units are flexible allowing for thermal and seismic movement.

Water intrusion at the top floor gutter created severe corrosion to the structural steel members and to the terra-cotta anchors weakening the structure. Architectural Facades selected for removal, several of the original terra-cotta castings that were then repaired and readied for the mold making process. Polyurethane rubber molds were made over the high quality terra-cotta castings - columns, capital & base, rosettes, shell and facial ornaments, dentals, egg and dart moldings to replicate to exact detail of original terra-cotta castings.

The challenge in this project was to produce castings with the exact shape, color, and finish of the original terra-cotta. Architectural Facades Unlimited created the perfect GFRC color match and mix design. The contractor applied a glaze and seal coating over the GFRC units. The final appearance of the GFRC and terra-cotta is indistinguishable.

GREEN, SUSTAINABLE, AND RESILIENT
RESPONSIBLE - Using Lehigh White Portland Limestone Cement (PLC) is an environmentally responsible choice. Production of this earth friendly cement generates about 10% less CO2 than other Portland Cements, while still delivering the consistency, versatility and performance Lehigh customers, like Architectural Facades Unlimited, come to expect.

GREEN BUILDING - Lehigh White Portland Cement allows for the production of a more sustainable concrete product for owners and designers who want a green option in architectural concrete products.

RESILIENT - Functional resilience incorporates many aspects of building design and construction, and while a very broad concept, designs that include provisions for functional resilience will tend to be more durable, robust, disaster resistant, have longer life expectancies, and be more readily adapted for reuse and even re-purposing.
Beckwith
Restoration Project
Los Gatos, California

Beckwith Building after the 1989 Earthquake from 1893 photographs.
Lightweight GFRP enabled the owner to restore this building.
Current codes and seismic restrictions would have made restoration of this project cost prohibitive if restored in original materials.

The Ritz Carlton
Restoration Project
San Francisco, California
APA Award of Excellence

JURY COMMENTS:
This project exemplifies how best to successfully restore a portion of the facade of an existing architectural gem. Not only did the various elements blend with their respective adjacent materials, the systems used showed that a near perfect solution can be achieved. Control from beginning to the end shows a mastery of this type of work. Well done! The level of detail of the new castings matches the level of quality of the original stonework.

Pulldown the mold from the pattern created by our in-house craftsmen.
